Screening, Brief Intervention, and Referral to Treatment

An Evidence-Based Approach

SCREENING
The following information has been adapted from the SAMHSA Core Curriculum: *Screening Patients for Substance Use in Your Practice* Setting, and slides by the National Screening, Brief Intervention & Referral to Treatment (SBIRT) Addiction Technology Transfer Center (ATTC) Network.

This project was a collaboration with the National ATTC, the Institute for Research, Education & Training in Addictions (IRETA) and the University of Pittsburgh School of Nursing.
Project Funding

This project was supported in part by funds from the Center for Substance Abuse Treatment, Substance Abuse and Mental Health Services Administration (SAMHSA), Department of Health and Human Services (DHHS) under grant number 1U79TI025365, “SBIRT Training for Nurse Practitioners Across the Lifespan”. The information or content and conclusions are those of the author and should not be construed as the official position or policy of, nor should any endorsements be inferred by the Center for Substance Abuse Treatment, SAMHSA, DHHS, or the U.S. Government.
What is SBIRT?

SBIRT is a comprehensive, integrated, public health approach to the delivery of early intervention and treatment services

• For persons with substance use disorders and
• Those who are at risk of developing these disorders

Primary care, mental health, inpatient hospital, dental and community settings provide opportunities for intervention with at-risk substance users before more severe consequences occur

(SAMHSA, 2017)
Why Screen Universally?

- Drinking and substance use are common but often go undetected
  - Research has shown nearly 90% of adults in need of substance use treatment go untreated
- Screening provides opportunities to intervene
  - Earlier detection of health problems related to at-risk alcohol/substance use
  - Identify alcohol/substance use patterns that can increase risk of injury or illness
  - Educate about at-risk alcohol and substance use

(SAMHSA, 2017)
### Prevalence of Substance Use

<table>
<thead>
<tr>
<th>Substance</th>
<th>Female (12 years and older)</th>
<th>Male (12 years and older)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tobacco</td>
<td>20.2%</td>
<td>31.1%</td>
</tr>
<tr>
<td>Alcohol (current drinkers)</td>
<td>47.5%</td>
<td>57.1%</td>
</tr>
<tr>
<td>Illicit Drugs</td>
<td>7.3%</td>
<td>11.5%</td>
</tr>
</tbody>
</table>

(SAMHSA- NSDUH Series H-48, 2014)
Detect Risk Factors Early

Screening can lead to more effective intervention

- The clinician is often the first point of contact
- Patients often seen by clinician due to related health problems
- Early identification and intervention lead to better outcomes

(SAMHSA, 2013)
At-Risk Alcohol Use

- **Men**: No more than 4 drinks on any day *and* no more than 14 drinks per week
- **Women (and anyone age 65+)**: No more than 3 drinks on any day *and* no more than 7 drinks per week

(NIAAA, 2017)
What is a Standard Drink?

12 oz of beer  

5 oz of wine  

1.5 oz of liquor
U.S. Population

Alcohol Use Disorder

At-Risk or Harmful Use
Number of deaths by risk factor, World, 2016

Total annual number of deaths by risk factor, measured across all age groups and both sexes.

- High blood pressure: 10.46 million
- Smoking: 6.32 million
- High blood sugar: 5.61 million
- High body-mass index (obesity): 4.53 million
- High cholesterol: 4.39 million
- Outdoor air pollution: 4.09 million
- Alcohol use: 2.81 million
- Household air pollution: 2.58 million
- Diet low in fruits: 2.36 million
- Diet low in vegetables: 1.52 million
- Low physical activity: 1.37 million
- Unsafe water source: 1.16 million
- Unsafe sex: 1.1 million
- Child wasting: 906,385.64
- Poor sanitation: 888,238.69
- Secondhand smoke: 883,830.78
- Low birth weight: 779,370.46
- No access to handwashing facility: 750,338.02
- Drug use: 451,821.63
- Low bone mineral density: 441,226.32
- Child stunting: 152,189.26
- Non-exclusive breastfeeding: 144,110.47
- Vitamin-A deficiency: 42,163.49
- Zinc deficiency: 25,087.98
- Iron deficiency: 20,950.1
- Discontinued breastfeeding: 10,037.86

Source: IHME, Global Burden of Disease (GBD)

(Global Burden of Disease Collaborative Network, 2017)
Alcohol Use Pyramid

Level of Use
- Alcohol Use Disorder
- At-Risk or Harmful
- Low Risk or Abstinent

Prevalence in US
- ~ 5%
- ~ 25%
- ~ 70%

Goals
- Referral to Treatment
- Brief Intervention and/or Brief Treatment
- Education and Positive Reinforcement

(Babor, Higgins-Biddle, Saunders, Maristela, & Monteiro, 2001, b)
Don’t Ask-Don’t Tell?

- Public health experts recommend alcohol screening and brief intervention (ASBI) should happen more often
  - ASBI can reduce drinking by **25%** in people who drink too much (CDC, 2014)
- Alcohol use and drug issues are often unidentified
  - **1 out of 6** adults discussed alcohol use with a health professional (McKnight-Eily et al., 2015)
  - Only 29% of trauma surgeons screened patients for alcohol problems (Danielson et al., 1999)
What Can We Do?

- Identify use, at-risk use, and harmful use; with a validated screening tool
- Connect use/at-risk use to health related issues
- Encourage cutting back
- Conduct a brief intervention
- Refer for formal assessment/treatment, as necessary
SBIRT as a Response Option

Primary Prevention
- Abstinence
- Infrequent Use

Brief Intervention
- At-Risk Use

AUD Treatment
- Alcohol Use Disorder
SBIRT Effectiveness

Harris County (Texas) Hospital District Study:

- Patients reporting any days of heavy drinking dropped from 70% at intake to 37% at 6-month follow-up
- Patients reporting any days of drug use dropped from 82% at intake to 33% at follow-up

(InSight Project Research Group and The InSight Project Research Group, 2009)
SBIRT Cost-Effectiveness

- Alcohol SBIRT generates costs savings and improves health in both ED and outpatient settings
- EDs provide better effectiveness at a lower cost and greater social cost reductions than outpatient

(Barbosa et al., 2015)
Patient Outcome Studies

• The SAMHSA Cross-site evaluation included a sample of over 17000 patients (Aldridge, Linford, & Bray, 2017)

• Patients receiving SBIRT reduced alcohol use by 36%, heavy alcohol use by 43%, and drug use by 75%

• Intensity of intervention was associated with reduced use

• Patient Testimonies- [Link](http://www.youtube.com/watch?v=jWY6qWqHtlg)
What is screening?

- A preliminary assessment
  - Indicates probability that a specific condition is present
- Opportunity for education, early intervention
- Alerts provider to risks for interactions with medications or other aspects of treatment
- Offers opportunity to engage patient further
- Reduce high-risk activities for people without an AUD

(Winters et al. 1994)
Screening and Intervening: Barriers

- Lack of awareness and knowledge about tools for screening
- Sense of not having enough time
- Discomfort with initiating discussion about substance use/at-risk use
Screening in a Practice Setting

- Most practices use a teaming approach

(SAMHSA, 2013)
Pre-screening Tools

Validated, brief pre-screening tools:

- The NIDA Single-Question Screening for Drug Use
- The NIAAA Single-Question Screening for Alcohol Use
- The AUDIT-C (3 item screen)

**Negative**
- Based on previous experiences with SBIRT, screening will yield **75% negative responses.**

**Positive**
- If you get a positive screen, you should ask further assessment questions.

(SAMHSA, 2013)
Alcohol Pre-Screen
NIAAA Single-Question Screening for Alcohol Use

“How many times in the past year have you had X or more drinks in a day?”

*For men X=5, women X=4

- Identifies at-risk alcohol use
- Positive screen= 1 or more times
- Follow positive screens with more detailed screening/ possibly a brief intervention

(NIAAA, 2007)
Drug Pre-Screen
NIDA Single-Question Screening Test for Drug Use

“How many times in the past year have you used an illegal drug or used a prescription medication for non-medical reasons?”

• Identifies substance use risk
• Positive screen= 1 or more
• Follow positive screens with more detailed screening/ possibly a brief intervention

(National Institute on Drug Abuse, 2011)
Alcohol Pre-Screen

AUDIT-C

1. How often do you have a drink containing alcohol?
   - a. Never
   - b. Monthly or less
   - c. 2-4 times a month
   - d. 2-3 times a week
   - e. 4 or more times a week

2. How many standard drinks containing alcohol do you have on a typical day?
   - a. 1 or 2
   - b. 3 or 4
   - c. 5 or 6
   - d. 7 to 9
   - e. 10 or more

3. How often do you have six or more drinks on one occasion?
   - a. Never
   - b. Less than monthly
   - c. Monthly
   - d. Weekly
   - e. Daily or almost daily

• A 3-question pre-screen
• Next steps determined by score

(Babor, Higgins-Biddle, Saunders, Maristela, & Monteiro, 2001, a)
Interpretation of AUDIT-C

- The AUDIT-C is scored on a scale of 0-12
  - A score of 0 reflects no alcohol use
  - In men, a score of 4+ is considered positive
  - In women and anyone 65+, a score of 3+ is considered positive

- If AUDIT-C score is positive, it should be followed up with the full AUDIT

(NIAAA, 2013)

(Addiction Technology Transfer Center (ATTC) Network, 2013)
AUDIT

Alcohol Use Disorders Identification Test
About the AUDIT

• Acronym- Alcohol Use Disorders Identification Test
• Developed by the World Health Organization (WHO)
• Includes 10 brief questions
• Designed specifically for use in primary care
• Proven to demonstrate levels of drinking behavior
  – Evaluated over a period of two decades
  – Accurate across age, gender and different cultures
  – Cross-national standardization

(NIAAA, 2013)
Introducing the AUDIT

“Now I am going to ask you some questions about your use of alcoholic beverages during the past year. Because alcohol use can affect many areas of health (and may interfere with certain medications and treatment), it is important for us to know how much you usually drink and whether you have experienced any problems with your drinking. Please try to be as honest and as accurate as you can be.”

DAST
Drug Abuse Screening Test
About the DAST

• Brief self-report questionnaire- 10 items
• Measures the degree of consequences related to drug use
  – Shortened version of DAST 28, containing 10 items, completed as self-report or via interview. DAST(10) consists of screening questions for at-risk drug use that parallel the MAST (an alcohol screening instrument)
  – Developed by Addiction Research Foundation, now the Center for Addiction and Mental Health
  – Yields a quantitative index of problems related to drug misuse

(Washington State Department of Social and Health Services, 2014)
Prescription Drug Misuse

Although many people take medications that are not prescribed to them, we are primarily concerned with—

• Opioids (oxycodone, hydrocodone, fentanyl, methadone)
• Benzodiazepines (clonazepam, alprazolam, diazepam)
• Stimulants (amphetamine, dextroamphetamine, methylphenidate)
• Sleep aids (zolpidem, zaleplon, eszopiclone)
• Other assorted (clonidine, carisoprodol)

(SAMHSA, 2013)

(Washington State Department of Social and Health Services, 2014)
Screening: Summary

• Screening is the first step of the SBIRT process and determines the severity and risk level of the patient’s substance use.

• The result of a screen allows the provider to determine if a brief intervention or referral to treatment is a necessary next step for the patient.

(SAMHSA, 2013)
Key Points for Screening

- Screen everyone.
- Screen both alcohol and drug use including prescription drug abuse and tobacco.
- Use a validated tool.
- Prescreening is usually part of another health and wellness survey.

(SAMHSA, 2013)
Key Points for Screening

- Explore **each** substance; many patients use more than one.

- **Follow up** positives or "red flags" by assessing details and consequences of use.

- Use your MI skills and show **nonjudgmental, empathic** verbal and nonverbal behaviors during screening.

(SAMHSA, 2013)
Patient Interview

• The patient is not intoxicated or in need of emergency care at the time;
• The purpose of the screening is clearly stated in terms of its relevance to the patient’s health status;
• The interviewer is non-judgmental and non-threatening;
• The information patients need to understand the questions and respond accurately is provided; and
• Assurance is given that the patient’s responses will remain confidential.

(Babor, Higgins-Biddle, Saunders, Maristela & Monteiro, 2001a)
Next Steps- Brief Intervention

• For those not ready to change
  • May increase their motivation
• For those ready to change
  • Provides advice on appropriate goals and strategies
  • Provides support
